

Sustainable Information for Shine 219

This fabric contributes to points for LEED-CI in the following way:

- MR Credit 1.1-1.4, Innovation in Design (water efficiency): 1-4 points

This fabric offers the following environmental advantages:

- No water pollution as in conventional fabrics. Shine is solution dyed, meaning the color is added to the fiber in its liquid state rather than using the traditional dye bath method. This means virtually no energy is used to color the fiber, and no waste water is created that could pollute the rivers and ground.
- Because Shine is made of extremely durable 100% nylon, it will have a longer useful life, thus reducing the need to discard after a shorter period of time.
- Shine is easily cleaned with harsher chemicals. This means its new appearance can easily be retained, preventing the need for early replacement.
